K-CAPS®

DELAYED RELEASE CAPSULES

K-CAPS® Delayed-Release Capsules contain a material that prevents them from dissolving until they reach the small intestine. In this way the capsules act as a barrier against stomach acid, safeguarding their contents from the stomach's harsh environment - without the added cost and complexity of incorporating coatings or acid-resistant properties during manufacturing.

WHAT ARE THE BENEFITS OF DELAYED-RELEASE CAPSULES?

K-CAPS® Delayed-Release Capsules offer:

- The capsules do not dissolve until they reach the small intestine.
- Shorter product development cycle and lower manufacturing costs : These capsules eliminate the need for the chemicals, phthalates, solvents or additional coatings or processes that tablets and other dosage forms require in order to delay release.
- Broad protection: In addition to safeguarding encapsulated ingredients against the effects of stomach acids, K-CAPS® Delayed-Release Capsules also safeguard against pH fluctuations, temperature variations, moisture, humidity and oxygen penetration.
- Enhanced bioavailability: By protecting ingredients from stomach acids and strategically releasing active ingredients in the intestines, K-CAPS® Delayed-Release Capsules ensure maximum absorption and effectiveness.
- Reduced nutrient competition: Because they release nutrients in a controlled manner, these capsules also reduce the possibility of the capsule's ingredients competing with other supplements and medications for absorption.
